

## WATER DISTILLATION UNIT

Code : G045

- The ALFA Water Distillation Unit is engineered to produce high-purity distilled water essential for various laboratory applications. Its fully automatic operation, managed by a microprocessor control system, ensures consistent and reliable performance.
- Constructed with stainless steel components—including the boiling vessel, storage tank, and condenser—the unit offers durability and resistance to corrosion. It delivers distilled water with a conductivity of approximately 2.5  $\mu\text{S}/\text{cm}$  at 20°C, suitable for general laboratory use.
- The system incorporates several safety and efficiency features:
  - A gas exhaust chimney facilitates the discharge of CO<sub>2</sub> and other gases.
  - Warning lights provide operational status indicators.
  - An automatic shutdown function halts operation when the storage tank reaches full capacity and resumes when the tank empties.
  - A Siliphos filter prevents calcification of the heating elements, extending their lifespan.
  - Sensors detect the absence of water, automatically stopping the heaters to prevent burnout.

- Designed for versatility, the unit can be installed on a tabletop or wall-mounted, accommodating various laboratory layouts. Its energy-efficient design preheats inlet water, reducing overall power consumption. Maintenance is streamlined through easy access to heating elements and internal components.

## **STANDARDS**

ASTM D1193 • ISO 3696

## **TECHNICAL SPECIFICATIONS**

- Conductivity: ~2.5  $\mu\text{S}/\text{cm}$  at 20°C
- Power Supply: 380 V / 50–60 Hz
- Construction: Stainless steel boiling vessel, storage tank, and condenser
- Installation: Suitable for tabletop or wall-mounted use

## **EQUIPPED WITH**

- Siliphos filter
- Warning lights
- No-water detection sensor
- Water storage tank
- Gas exhaust chimney

## **ORDERING INFORMATION**
